*Quantification of static connectivity between deep-water channels and stratigraphically adjacent architectural elements using outcrop analogs*

Jonathan E. Funk, Roger M. Slatt, and David R. Pyles

## ABSTRACT

This article uses data from well-exposed outcrops and published information to document static connectivity in deep-water channelized systems. Two measures of static reservoir connectivity on outcrop analogs are proposed: margin connectivity and sand-on-sand connectivity. Margin connectivity ( $C_m$ ) is the length between two stratigraphically adjacent elements not obstructed by a barrier normalized by the total length of the interface. Sand-on-sand connectivity ( $C_s$ ) is the length of sand-on-sand contacts between two stratigraphically adjacent elements normalized by the total length of the interface.

The  $C_m$  and  $C_s$  are analyzed with regard to four categories: (1) association of architectural elements, (2) stacking pattern of channel elements, (3) setting on the slope-to-basin profile, and (4) net sand content. Results are as follows. First, connectivity varies by association of architectural elements. Channel-lobe contacts have higher  $C_m$  and  $C_s$  than channel-channel and channel-levee contacts. Second, connectivity varies by stacking pattern of channel elements. Predominantly vertically stacked channel elements have higher  $C_m$  and  $C_s$  than predominantly laterally stacked channel elements. Also, disorganized non-sequentially stacked channel elements have higher  $C_m$  than organized systematically stacked channel elements. Third, connectivity varies by setting on the slope-to-basin profile. Channel elements in confined settings have higher  $C_m$  than both

## AUTHORS

JONATHAN E. FUNK ~ ConocoPhillips School of Geology and Geophysics, University of Oklahoma, 100 East Boyd Street, Suite 710, Norman, Oklahoma 73019; present address: Marathon Oil, 5555 San Felipe Road, Houston, Texas 77056; [jfunk@marathonoil.com](mailto:jfunk@marathonoil.com)

Jonathan E. Funk is a geologist with Marathon Oil in Houston, Texas, working in international new ventures. He received his B.S. degree in geology from Texas A&M University and his M.S. degree in geology from the University of Oklahoma. His scientific interests are in deep-water depositional systems and reservoir characterization.

ROGER M. SLATT ~ ConocoPhillips School of Geology and Geophysics, University of Oklahoma, 100 East Boyd Street, Suite 710, Norman, Oklahoma 73019; [rslatt@ou.edu](mailto:rslatt@ou.edu)

Roger M. Slatt currently holds the Gungoll Family Chair Professor in Petroleum Geology and Geophysics and is director of the Institute of Reservoir Characterization in the ConocoPhillips School of Geology and Geophysics at the University of Oklahoma. He teaches courses in shale geology, reservoir characterization, sequence stratigraphy, and petroleum geology of deep-water depositional systems for societies and companies globally, as well as at the University of Oklahoma. He has been an Esso Australia distinguished lecturer, AAPG distinguished lecturer, and Society of Petroleum Engineers distinguished lecturer, and has been awarded AAPG honorary membership, the AAPG Gower Murray Distinguished Educator Award, and Society of Petroleum Geophysicists Special Commendation Award.

DAVID R. PYLES ~ Chevron Center of Research Excellence, Department of Geology and Geological Engineering, Colorado School of Mines, Golden, Colorado 80401; [dpyles@mines.edu](mailto:dpyles@mines.edu)

David R. Pyles is director of the Chevron Center of Research Excellence and research professor of the Department of Geology and Geological Engineering at the Colorado School of Mines. He and his graduate students focus their research efforts on various aspects of petroleum geology, including quantitative stratigraphy,
